## CROSS-PLATFORM INTERFACES

For most use cases, these interfaces (in particular `get_peer_uid_gid()`) should be enough.

**get\_peer\_uid\_gid**(*sock*)

Returns the (uid, gid) of the peer connected to the given **stream** socket.

**get\_peer\_pid\_uid\_gid**(*sock*)

Returns the (pid, uid, gid) of the peer connected to the given **stream** socket.

On some platforms, this function is not available. On other platforms, the returned PID may be `None` if the current version of that platform does not support retrieving the PID (for example, FreeBSD prior to version 13 does not, and will always return `None`).

Availability: Linux, OpenBSD, NetBSD, FreeBSD (PID only available on version 13+), macOS, Solaris, Illumos

## PLATFORM-SPECIFIC INTERFACES

In most cases, you should use the cross-platform interfaces. However, the platform-specific interfaces may be useful (for example, they may provide additional information).

### **get\_peerpid**(*sock*)

Returns the PID of the process that last accessed the given stream socket.

Availability: macOS

## 2.1 ucred

The `ucred` module provides an interface to the `ucred` interface on Linux, the `sockpeercred` interface on OpenBSD, or the `unpcbuid` interface on NetBSD.

The reason that the interfaces for all three of these are in one module is that they are all essentially the same interface, with only minor implementation differences (such as the order of the fields in the C struct, or the name of the socket option used to retrieve them).

---

**Note:** This module is only here for completeness. In nearly all cases, you should use `get_peer_pid_uid_gid()` (which has slightly better cross-platform support) instead.

---

### **class** `ucred.Ucred`

Availability: Linux, OpenBSD, NetBSD

#### **pid**

**Type** `int`

The PID of the connected peer.

#### **uid**

**Type** `int`

The effective UID of the connected peer.

#### **gid**

**Type** `int`

The effective GID of the connected peer.

### `ucred.get_ucred`(*sock*)

Returns a `Ucred` object representing the credentials of the peer connected to the given socket.

Availability: Linux, OpenBSD, NetBSD

## 2.2 xucred

The xucred module provides an interface to the xucred interface on FreeBSD, DragonflyBSD, and macOS.

### **class** xucred.Xucred

Availability: FreeBSD, DragonFlyBSD, macOS

#### **pid**

**Type** int or None

The PID of the connected peer.

This attribute is only set on FreeBSD 13+. On macOS/DragonFlyBSD, and on previous versions of FreeBSD, it is always None. Always make sure to check for a None value.

To get the PID on macOS, use [`get\_peerpid\(\)`](#).

Availability: FreeBSD 13+

#### **uid**

**Type** int

The effective UID of the connected peer.

#### **gid**

**Type** int

The effective GID of the connected peer.

#### **groups**

**Type** list[int]

The supplementary groups of the connected peer.

---

**Note:** On macOS, the value placed in this attribute differs from that of [`os.getgroups\(\)`](#). Effectively, it always behaves as if the deployment target is less than 10.5.

---

---

**Note:** On FreeBSD, this group list is truncated to the first 16 supplementary groups. (Technically, it's also truncated on DragonflyBSD and macOS, but they only support 16 groups normally.)

---

### **xucred.get\_xucred(sock)**

Returns a [`Xucred`](#) object representing the credentials of the peer connected to the given socket.

Availability: FreeBSD, DragonFlyBSD, macOS

## 2.3 peerucred

The `peerucred` module provides an interface to the `getpeerucred()` function on Solaris/Illumos.

**Warning:** This module is experimental and has undergone no testing whatsoever. Use with caution.

### **class** `peerucred.Ucred`

Availability: Solaris, Illumos

#### **pid**

**Type** `int`

The PID of the connected peer.

#### **ruid**

**Type** `int`

The real UID of the connected peer.

#### **euid**

**Type** `int`

The effective UID of the connected peer.

#### **suid**

**Type** `int`

The saved UID of the connected peer.

#### **rgid**

**Type** `int`

The real GID of the connected peer.

#### **egid**

**Type** `int`

The effective GID of the connected peer.

#### **sgid**

**Type** `int`

The saved GID of the connected peer.

#### **groups**

**Type** `list[int]`

The supplementary groups of the connected peer.

### `peerucred.getpeerucred(sock)`

Returns a [\*Ucred\*](#) object representing the credentials of the peer connected to the given socket.

Availability: Solaris, Illumos
